

THE GUINNESS GLOBAL ENERGY REPORT

Developments and trends for investors in the global energy sector

June 2018

GUINNESS GLOBAL ENERGY FUND

Fund size: \$285m (31.5.2018)

The Guinness Global Energy Fund invests in listed equities of companies engaged in the exploration, production and distribution of oil, gas and other energy sources. We believe that over the next twenty years the combined effects of population growth, developing world industrialisation and diminishing fossil fuel supplies will force energy prices higher and generate growing profits for energy companies.

The Fund is run by Will Riley, Jonathan Waghorn and Tim Guinness. The investment philosophy, methodology and style which characterise the Guinness approach have been applied to the management of energy equity portfolios since 1998.

Important information about this report

This report is primarily designed to inform you about recent developments in the energy markets invested in by the Guinness Global Energy Fund. It also provides information about the Fund's portfolio, including recent activity and performance. This document is provided for information only and all the information contained in it is believed to be reliable but may be inaccurate or incomplete; any opinions stated are honestly held at the time of writing, but are not guaranteed. The contents of the document should not therefore be relied upon. It is not an invitation to make an investment nor does it constitute an offer for sale.

HIGHLIGHTS FOR MAY

OIL

Brent up and WTI down; Iran sanction, OPEC tapering and Permian constraints to the fore

Brent rose but WTI fell up over the month; Brent rose from \$74.9/bl to \$77.0/bl; WTI fell from \$68.6/bl to \$67.0/bl. President Trump followed through on his promise to renew sanctions against Iran, which likely reduces Iranian exports. In response to the tightness in the market, OPEC responded with talk of starting to taper their quota cut in 2H 2018. WTI hit by local oversupply issues as surging Permian activity comes up against infrastructure and service bottlenecks.

NATURAL GAS

US gas prices up; inventories low

Henry Hub prices were higher on the month, rising from \$2.76/mcf to \$2.97/mcf. US natural gas inventories are close to 10 year lows, but onshore US supply in March 2018 (latest EIA data) rose by 1 Bcf/day to 86.1 bcf/day, 9.7 bcf/day higher than twelve months ago.

EQUITIES

Energy outperforms the broad market

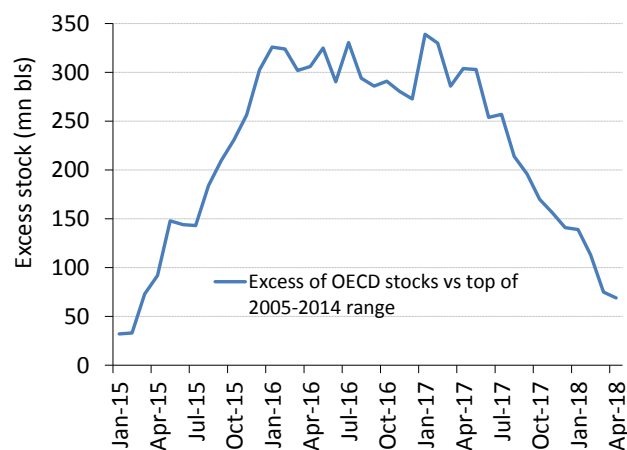

The MSCI World Energy Index rose in May by 1.7%, outperforming the MSCI World Index which rose by 1.4% (all in US dollar terms). For the year to May 31 2018, the MSCI World Energy Index is ahead of the MSCI World by 4.2%.

CHART OF THE MONTH

Decline in OECD inventories accelerated by Venezuela/demand

The oil market started to tighten in the second half of 2017, as OPEC's production cuts fed properly into the export market. Strong demand growth and a sharp decline in Venezuelan supply have acted to accelerate the corresponding fall in OECD oil inventories. With Iranian oil export sanctions now looming, OPEC are considering easing their quota cuts earlier than some were expecting. We see this as rational stewardship of the oil price from Saudi, who know that too high, too soon would be counterproductive.

1. MAY IN REVIEW

i) Oil market

Figure 1: Oil price (WTI and Brent \$/barrel) 18 months November 30 2016 to May 31 2018

Source: Bloomberg LP

The West Texas Intermediate (WTI) oil price started May at \$68.6/bl and, after trading steadily up to a high of \$72.2/bl on May 21, fell back to close the month little changed at \$67.0/bl. WTI has averaged \$65.1/bl so far in 2018, having averaged \$51 in 2017, \$43.4 in 2016, \$48.7 in 2015 and \$93.1 in 2014.

Brent oil traded more strongly, opening at \$74.9/bl, peaking in the month at \$79.2/bl, and closing at \$77.3/bl. Brent has averaged \$70.2/bl so far in 2018. The gap between the WTI and Brent benchmark oil prices widened during the month, ending May at \$10.3/bl, having been around \$6/bl in April.

Factors which strengthened WTI and Brent oil prices in May:

- **Renewed Iranian sanctions**

On May 8, US President Trump announced his decision to cease the United States' participation in the Joint Comprehensive Plan of Action (JCPOA). The JCPOA is an international agreement adopted in January 2016 that waived US/UN/EU sanctions against Iran in exchange for the country accepting limits on its nuclear program and allowing inspections of its nuclear facilities. The current sanctions, which up until now were waived, effectively block Iranian exports to countries that do business with the US. The impact on Iranian oil exports remains unclear, but using previous sanctions as a guide, we expect a decline of 0.3-0.5m b/day (versus current exports of 2m b/day).

- **Tightening OECD inventories**

In their May report, the IEA estimated that OECD inventories stayed around flat in April, having declined by 22m barrels in March. Both months imply the market being around 0.7m b/day undersupplied versus long term average inventory movements. Total OECD oil and product inventories are now around 60m barrels higher than the 10 year average, the surplus having come down from around 300m barrels in 2015/16.

Factors which weakened WTI and Brent oil prices in May:

- **Discussion of OPEC/Russia raising production**

Towards the end of May, OPEC and Russia indicated that they were considering easing the oil production cuts that have been in place since the start of 2017. Speaking at the St Petersburg International Economic Forum, Saudi Energy Minister Khalid Al-Falih stated that “in the near future there will be time to release supply... to do what is necessary to reassure consumers”. His Russian counterpart, Alexander Novak, echoed Al-Falih’s comments, implying that OPEC and Russia would increase their oil output in the third quarter of 2018. The move to raise production would come as oil markets in 2018 have been tighter than anticipated at the start of the year, thanks mainly to a decline in Venezuelan production. Nevertheless, talk of raising production by up to 1m b/day helped to dampen spot oil prices.

- **Rise in US onshore drilling rig count**

The US oil directed drilling rig count rose by 36 rigs during May, up to 861 rigs. This compares to a low in the middle of 2016 of 316 rigs, and an average rig count in 2017 of 703 rigs. Whilst not a significant jump, the rig count has now risen over the last year by around 20%, which will result in some acceleration in US onshore oil supply.

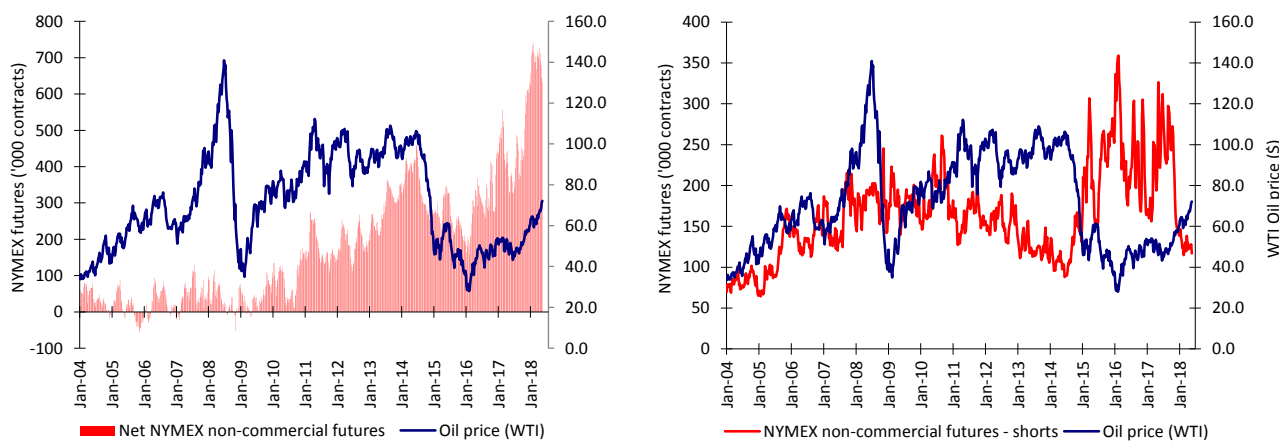

- **Increased US onshore oil supply**

At the start of June, the EIA reported that US onshore production increased by 235k b/day during April 2018. This puts year over year growth for the US onshore system at around 1.4m b/day. Using production guidance data provided by the larger shale producers, we expect the US onshore oil system to maintain a similar pace of growth for the rest of the year.

Speculative and investment flows

The New York Mercantile Exchange (NYMEX) net non-commercial crude oil futures open position (WTI) fell in May, ending the month at 633,000 contracts long versus 712,000 contracts long at the end of April. Typically there is a positive correlation between the movement in net position and movement in the oil price. The gross short position reduced from 126,000 contracts to 117,000 contracts. This short position is now at relatively low level versus those seen in the last couple of years.

Figure 2: NYMEX Non-commercial net and short futures contracts: WTI January 2004 – May 2018

Source: Bloomberg LP/NYMEX/ICE (2018)

OECD stocks

OECD total product and crude inventories at the end of April (the latest data point available) were estimated by the IEA to be 2,819m barrels, flat versus the level reported for March. This compares to a 10-year average build for April of 19m barrels. Inventories have been tightening since the middle of 2017, and remain around 60m barrels above the ‘normalised’ (pre-2015) range. We expect them to continue to tighten over 2018, predominantly as a result of OPEC’s quota system.

Figure 3: OECD total product and crude inventories, monthly, 2004 to 2018

Source: IEA Oil Market Reports (May 2018 and older)

ii) Natural gas market

The US natural gas price (Henry Hub front month) opened May at \$2.76/mcf (1,000 cubic feet). The price rose gradually through the month, closing at a high of \$2.97/mcf. The spot gas price has averaged \$2.82/mcf so far in 2018, which compares to an average gas price of \$3.02 in 2017, \$2.55/mcf in 2016 and \$2.61/mcf in 2015. The price averaged around \$3.90/mcf over the preceding five years (2010-2014).

The 12-month gas strip price (a simple average of settlement prices for the next 12 months’ futures prices) was also up over the month, opening at \$2.82/mcf and closing at \$2.94/mcf. The strip price averaged \$3.12 in 2017 and \$2.84 in 2016, having averaged \$2.86 in 2015, \$4.18 in 2014 and \$3.92 in 2013.

Figure 4: Henry Hub gas spot price and 12m strip (\$/Mcf) November 30 2016 to May 31 2018

Source: Bloomberg LP

Factors which strengthened the US gas price in May included:

- Depressed gas inventories**
 US natural gas inventories were estimated to be around 1.6 Tcf at the end of May, 0.5 Tcf lower than the 10 year average, and very close to the 10 year low.
- Constraints to associated gas supply**
 Whilst the supply of associated gas in the US (i.e. gas produced as a by-product of shale oil) is growing well this year, infrastructure and service capacity constraints in Texas have lowered expectations for associated gas supply growth over the coming 12-18 months. This has served to boost both the Henry Hub spot price and twelve month pricing strip.

Factors which weakened the US gas price in May included:

- Strong US onshore natural gas production**
 Onshore US natural gas production averaged 86.1 Bcf/day in March 2018 (the latest available data point), up by 1.0 Bcf/day on the level reported for February. Onshore production has risen by 9.8 Bcf/day versus the level reported twelve months before, the highest year-on-year growth recorded. Rising associated gas supply from shale oil, and a pickup of activity in the Marcellus basin, are the key reasons for the rise in production: both look set to continue for the rest of 2018.
- Structurally oversupplied market**
 Adjusting for the impact of weather in May, the most recent injections of gas into storage suggest the market is, on average, around 1 bcf/day oversupplied (as indicated by the yellow dots on the graph below).

Figure 5: Weather adjusted US natural gas inventory injections and withdrawals

Source: Bloomberg LP; Guinness Asset Management

Natural gas inventories

Swings in the balance for US natural gas should, in theory, show up in movements in gas storage data. Natural gas inventories at the end of May were reported by the EIA to be 1.63 Tcf. The withdrawal season started with inventories peaking at 3.8 Tcf in mid-November, the lowest starting point of the winter season for US gas inventories since November 2014. Exceptionally cold weather and, until recently, an undersupplied market has brought inventories back from being at the top of the ten year range (in November and December) to being below seasonal norms during May.

Figure 6: Deviation from 5yr gas storage norm vs gas price 12-month strip (H. Hub \$/Mcf)

2. MANAGER'S COMMENTS

Are OPEC doing the right thing?

What has been said by Saudi/Russia in the last two weeks?

Towards the end of May, OPEC and Russia indicated that they would ease the oil production cuts that have been in place since the start of 2017. Speaking at the St Petersburg International Economic Forum, Saudi Energy Minister Khalid Al-Falih stated that “in the near future there will be time to release supply... to do what is necessary to reassure consumers”. His Russian counterpart, Alexander Novak, echoed Al-Falih’s comments, indicating that OPEC and Russia would increase their oil output in the third quarter of 2018. There also appears to be pressure from the US on OPEC to raise production by anything up to 1m b/day, after US retail gasoline prices rose to their highest level since 2014.

OPEC met informally on June 2 to discuss the proposals, and will hold their next formal meeting in Vienna on June 22. Predicting the precise outcome of that meeting is (as always) difficult, but it is instructive to consider whether or not an easing of production policy is warranted.

Why are OPEC/Russia contemplating this action?

The production cuts put in place by OPEC at the start of 2017 were designed to tighten an oversupplied market and raise oil prices from depressed levels. The cuts took around six months to feed into the physical market, with market tightness emerging in the second half of 2017 and first half of 2018. OECD oil and product inventories, which were sitting around 300m barrels above normal (an excess of around 12%), have declined to around 60m barrels above normal. This has coincided with the Brent oil price rallying from around \$50/bl twelve months ago to around \$80/bl at the end of May.

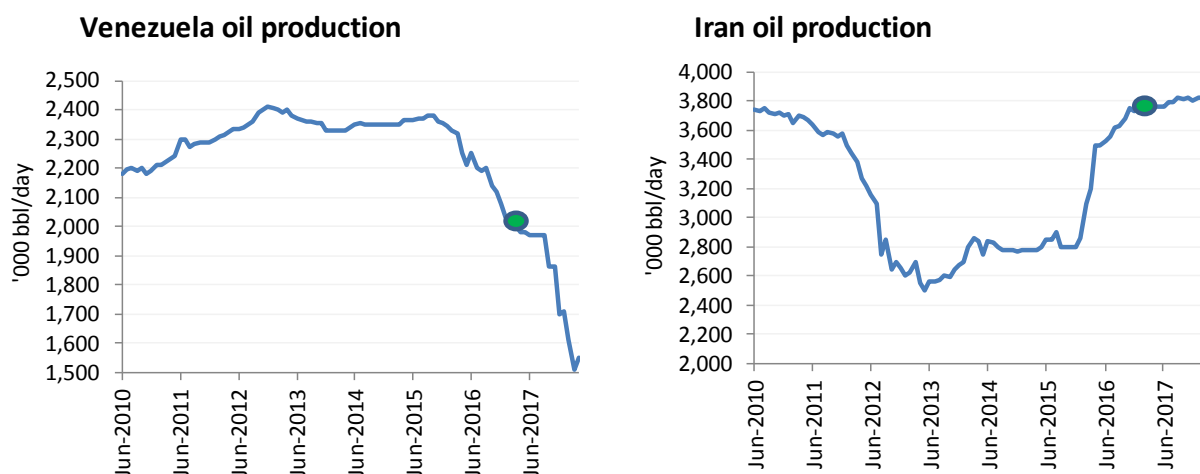

When the 2017 production framework was established, OPEC were relying on the discipline of their own members in adhering to the 1.2m b/day production cuts. That production discipline has been evident throughout, with members rationally embracing the trade-off of lower volumes for higher oil prices which has resulted in much stronger revenues. 0.6m b/day of cuts were promised by non-OPEC countries in support of OPEC’s actions, and in practice, we’ve seen around 0.4m b/day of these cuts come through, led by a Russian cut of 0.25m b/day. OPEC would also have been optimistic about oil demand in 2017 and 2018, and that optimism has been rewarded, with healthy demand growth of around 1.5m b/day expected in both years. Meanwhile, the US oil system is growing year-on-year by around 1.2m b/day, a level of growth anticipated by OPEC given where oil prices have been.

So far, so good. Since the start of 2018, however, we have seen two OPEC ‘wildcards’ muddy this picture, one being an actual reduction in supply from Venezuela, the other being the likelihood of lower supply from Iran. In Venezuela, production has fallen to an average of 1.5m b/day, nearly 0.5m b/day less than their quota of 1.97m b/day. Infrastructure issues, weak reservoir management, poor quality control and poor relations with foreign service partners have all contributed to the decline, and there seems little prospect of an improvement in the short-term. In Iran, President Trump’s decision to remove sanction waivers in relation to the country’s nuclear program, will effectively block Iranian exports to countries that do business with the US. The impact on Iranian oil exports remains unclear, but

Source: IEA; Guinness Asset Management

using previous sanctions as a guide, we expect a decline of at least 0.3-0.5m b/day (versus current exports of just over 2m b/day).

Green dot = OPEC quota cut, 1 Jan 2017

From a supply perspective, the latest news concerning both countries is not encouraging. In Venezuela, national oil company PDVSA has notified eight international customers that it will not be able to meet its full supply commitments for June, falling well short of the 1.5m b/day PDVSA is obligated to supply. The export picture from Iran remains far from clear, but recent indications suggest that various Asian importers (e.g. India), who supported Iranian crude during the previous round of sanctions, are likely now to bow to US pressure to reduce consumption from Iran. This implies that the overall decline in Iranian oil exports may be worse than first anticipated.

Why we expect Saudi to act rationally and raise production

In the face of a much tighter oil market than expected at the start of 2018, OPEC are therefore considering an early increase of their production quotas, starting the unwinding that was always promised, but previously signalled for 2019. Indeed, Saudi already indicated its commitment to supporting the stability of oil markets immediately after the U.S. decision to withdraw from the Iran nuclear deal, with Saudi's energy ministry making the following statement: "The kingdom will work with major producers and consumers within and outside OPEC to curb the effects of any supply shortages".

What to make of this? We continue to think that Saudi are managing the oil price in a rational fashion. On the one hand, the IMF still forecasting Saudi requiring oil price of \$70+ /bbl in 2018 in order to close their fiscal deficit to zero. An IPO or private sale of 5% of Saudi Aramco is also still planned: we estimate that the targeted \$100bn proceeds can only be achieved at an assumed long-term oil price of \$70. These factors underpin Saudi's efforts over the last twelve months to bring Brent back above \$70/bbl. However, Saudi are also well aware of the risks of over-stimulating non-OPEC supply (especially shorter cycle US shale oil), whilst also the dangers to oil demand growth posed by too sharp an oil price increase.

An increase in OPEC production is therefore to be expected, and we see it in the interests of energy investors, who we think are best served by a flattening of the oil curve: near-term oil prices falling a little to ensure that there is no oil shock to the world economy, whilst longer dated oil prices firm up, in recognition of the supply challenges caused by chronic underinvestment in non-OPEC outside the US.

Overall, we believe that Saudi/OPEC's long-term objective remains to maintain a 'good' oil price, higher than the current oil futures curve is indicating, and managing the unwinding of OPEC's production quotas is another step on that journey.

1) PERFORMANCE Guinness Global Energy Fund

The main index of oil and gas equities, the MSCI World Energy Index, was up by 1.7% in May, while the MSCI World Index rose by 1.2%. The Fund was up by 2.3% (class E) in the month, outperforming both indices (all in US dollar terms).

Within the Fund, May's strongest performers were Oasis, Valero, Petrochina, Devon and Occidental, while the weakest performers were Total, ENI, Halliburton, Canadian Natural Resourced and OMV.

Performance (in USD)												31/05/2018

Calculation by Guinness Asset Management Limited, simulated past performance prior to 31.3.08, launch date of Guinness Global Energy Fund. The Guinness Global Energy investment team has been running global energy funds in accordance with the same methodology continuously since November 1998. These returns are calculated using a composite of the Investec GSF Global Energy Fund class A to 29.2.08 (managed by the Guinness team until this date); the Guinness Atkinson Global Energy Fund (sister US mutual fund) from 1.3.08 to 31.3.08 (launch date of this Fund), the Guinness Global Energy Fund class A (1.49% OCF) from launch to 02.09.08, and class E (1.24% OCF) thereafter. Performance would be lower if an initial charge and/or redemption fee were included.

Past performance should not be taken as an indicator of future performance. The value of this investment and any income arising from it can fall as well as rise as a result of market and currency fluctuations as well as other factors. You may lose money in this investment.

Returns stated above are in US dollars; returns in other currencies may be higher or lower as a result of currency fluctuations. Investors may be subject to tax on distributions.

The Fund's Prospectus gives a full explanation of the characteristics of the Fund and is available at www.guinnessfunds.com.

2) PORTFOLIO Guinness Global Energy Fund

Buys/Sells

In May we sold our position in Hess Corporation and switched to a holding in Anadarko. Hess is a US listed exploration and production company with, today, focus on US unconventional oil production in the Bakken (North Dakota), and international oil developments offshore Guyana. The company has enjoyed strong share price performance over the last twelve months, thanks to a string of exploration discoveries in Guyanese waters, and high operational leverage to the rising oil price. However, we felt these factors became fully priced into the stock, prompting our decision to sell.

Anadarko is also a large diversified E&P company but one with a more attractive asset mix than Hess. In particular, the company has substantial exposure to the Delaware Basin in Texas, as well as midstream, Gulf of Mexico and East African interests. We believe that Anadarko can deliver handsome capital efficient production growth over the next 3-4 years, which should drive the stock to outperform.

Sector Breakdown

The following table shows the asset allocation of the Fund at **May 31 2018**.

Portfolio holdings

Our integrated and similar stock exposure (c.43%) is comprised of a mix of mid cap, mid/large cap and large cap stocks. Our four large caps are Chevron, BP, Royal Dutch Shell and Total. Mid/large and mid-caps are ENI, Statoil, Hess and OMV. At April 30 2018 the median P/E ratios of this group were 18.8x/15.3x 2017/2018 earnings. We also have two Canadian integrated holdings, Suncor and Imperial Oil. Both companies have significant exposure to oil sands in addition to downstream assets.

Our exploration and production holdings (c.37%) give us exposure most directly to rising oil and natural gas prices. We include in this category non-integrated oil sands companies, as this is the GICS approach. The stock here with oil sands exposure is Canadian Natural Resources. The pure E&P stocks have a bias towards the US (Newfield, Devon, Oasis and QEP Resources), with five other names (Apache, Occidental, ConocoPhillips, Noble, Anadarko) having a mix of US and international production and one (Tullow) which is African focused. One of the key metrics behind a number of the E&P stocks held is low enterprise value / proven reserves. Almost all of the US E&P stocks held also provide exposure to North American natural gas.

We have exposure to four (pure) emerging market stocks in the main portfolio, though one is a half-position, and in total represent 12% of the portfolio. Two are classified as integrated (Gazprom and PetroChina) and two as E&P companies (CNOOC and SOCO International). Gazprom is the Russian national oil and gas company which produces approximately a quarter of the European Union gas demand and trades on 4.1x 2018 earnings. PetroChina is one of the world's largest integrated oil and gas companies and has significant growth potential and, alongside CNOOC, enjoys advantages as a Chinese national champion. SOCO International is an E&P company with production in Vietnam.

The portfolio contains one midstream holding, Enbridge, North America's largest pipeline company. With the growth of onshore oil and gas production expected in the US and Canada over the next five years, we believe Enbridge is well placed to execute its pipeline expansion plans.

We have useful exposure to oil service stocks, which comprise around 11% of the portfolio. The stocks we own are split between those which focus their activities in North America (land driller Unit Corp) and those which operate in the US and internationally (Helix, Halliburton and Schlumberger).

Our independent refining exposure is currently in the US in Valero, the largest of the US refiners. Valero has a reasonably large presence on the US Gulf Coast and is benefitting from the rise in US exports of refined products seen in recent times.

Our alternative energy exposure is currently split between across two companies: JA Solar and Sunpower. JA Solar is a Chinese solar cell and module manufacturer whilst Sunpower is a more diversified US solar developer. We see them as well placed to benefit from the expansion in the solar market we expect to continue for a number of years.

Portfolio at April 30th 2018 (for compliance reasons disclosed one month in arrears)

Source: 2003 - 2008: IEA oil market reports; 2009 - 17: May 2018 Oil market Report

Global oil demand in 2017 was 10.8m b/day higher than the pre-financial crisis (2007) peak. This means the combined effect of the 2007/08 oil price spike and the 2008/09 recession was shrugged off remarkably quickly, thanks to growth in demand from emerging markets. The IEA forecast a rise of 1.5m b/day in 2018, which would take oil demand to an all-time high of 99.2m b/day.

OPEC

In December 2011, OPEC-12 introduced a group-wide target of 30m b/day without specifying individual country quotas. At the date of the announcement, and in the period since, OPEC's production has been complicated by numerous issues: notably (1) erratic production from Libya, affected by the ongoing civil war; (2) depressed production in Iran due to western sanctions over its nuclear programme; (3) real difficulty in forecasting how Iraq might develop.

In response to lower Libyan, Iranian and Nigerian production, and to cope with rising global oil demand, the three key swing producers within OPEC (Saudi, Kuwait and UAE) each raised their production significantly, as the following table shows:

('000 b/day)	31-Dec-10	30-Nov-14	31-Dec-16	30-Apr-18	Current vs Dec 2010 (start of Arab Spring)	Current vs Nov 2014 (OPEC hold mkt share)	Current vs Dec 2016 (OPEC cut production)
Saudi	8,250	9,650	10,480	9,900	1,650	250	-580
Iran	3,700	2,780	3,730	3,750	50	970	20
Iraq	2,385	3,370	4,630	4,430	2,045	1,060	-200
UAE	2,310	2,800	3,070	2,860	550	60	-210
Kuwait	2,300	2,790	2,860	2,700	400	-90	-160
Nigeria	2,220	1,970	1,500	1,810	-410	-160	310
Venezuela	2,190	2,350	2,080	1,550	-640	-800	-530
Angola	1,700	1,640	1,670	1,500	-200	-140	-170

OPEC-12	29,185	30,241	32,930	31,610	2,425	1,369	-1,320

Source: Bloomberg, DOE

The effect from 2011 to the middle of 2014 was OPEC-12 (ex Indonesia) producing at around 30m b/day, plus or minus 1m b/day, in an attempt to keep the global oil market in balance.

From the second half of 2014, we moved into a period where the global oil balance became looser, driven principally by surging non-OPEC supply (+2.4m b/day in 2014 and +1.4m b/day in 2015). The effect of \$100+ bbl oil, enjoyed for most of the 2011-2014 period, emerged in the form of an acceleration in US shale oil production and an acceleration in the number of large non-OPEC (ex US) projects reaching production.

Figure 7: OPEC-11 apparent production vs call on OPEC 2000 – 2018

Source: IEA Oil Market Report (May 2018 and prior); Guinness estimates

OPEC-12 met in November 2014, with the growing looseness in the physical market and a falling oil price (in the mid \$70s at the time of the meeting) prompting a significant change in strategy to one that prioritised market share over price. As a result, there was no quota cut, as many had anticipated, and a confirmation that the 30m b/day target would be maintained. Post the November 2014 meeting, OPEC-14 (Indonesia and Gabon joined the group) not only maintained their quota but also raised production significantly, up over 18 months by 2.5m b/day. Iraq recovered its production by 1.2m b/day; Iran by 0.8m b/day post the lifting of sanctions relating to their nuclear programme; and Saudi by 0.9m b/day.

In November 2016, OPEC stepped back from their market share stance, announcing plans for the first production cut since 2008, opting for a new production limit of 32.5m b/day. The announcement represented a cut of 1.2m b/day (all numbers for OPEC-14 including Gabon). There was also an understanding that non-OPEC, including Russia, would cut production by 0.6m b/day, which would bring the total reduction to 1.8m b/day.

The November 2016 announcement amounted to a 5% cut for all members except for 1) Libya and Nigeria, recognising their unusually depressed levels of production due to unrest, and 2) Iran, recognising its journey back to normalised production post the lifting of sanctions in January 2016. Indonesia has been suspended from the group since, as a net importer of oil, it chose not to participate. The agreed cuts came into effect on 1 January 2017, and were initially designed to be kept in place for six months, but have since been extended to the end of 2018. Compliance with the cuts has so far been strong and, after been delayed initially by a variety of temporary factors, is now causing inventories to decline. Having originally been excluded from the cuts, Libya and Nigeria are now included in the quota system.

OPEC has showed clear intention to end restore the current production cuts in a manner that is consistent with maintaining a balanced market.

Clearly, OPEC economies have been under significant stress, which has been the near-term driver for the decision to cut production and bring oil prices higher. There is also the growing concern that the oil industry will be unable to supply enough in the future, leading to the next oil price spike, though that is probably a secondary concern to OPEC at present.

Saudi's actions at the head of OPEC appear designed to achieve an oil price that to some extent closes their fiscal deficit (\$70-75/bl is needed to close the gap fully), whilst not spiking the oil price too high and over-stimulating non-OPEC supply. Longer term, we believe that Saudi seek a 'good' oil price, in excess of current levels to balance their fiscal needs, but they realise that patience is required to achieve that goal.

Overall, we reiterate two important criteria for Saudi:

1. Saudi is interested in the average price of oil that they get, they have a longer investment horizon than most other market participants
2. Saudi wants to maintain a balance between global oil supply and demand to maintain a price that is acceptable to both producers and consumers

Nothing in the market in recent years has changed our view that OPEC can put a floor under the price – as they did in 2008, 2006, 2001, 1998 – and again in 2016. Recent meetings and decisions indicate that OPEC have the resolve to continue in this manner.

Supply looking forward

The non-OPEC world has, since the 2008 financial crisis, grown its production more meaningfully than in the seven years before 2008. The growth was 0.9% p.a. from 2001-2008, increasing to 1.7% p.a. from 2008-2017.

Growth in the non-OPEC region over the last 5 years has been dominated by the successful development of shale oil and oil sands in North America (up around 4m b/day between 2010 and 2015), implying that the rest of non-OPEC region grew by only around 0.5m b/day over the period, despite the sustained high oil price until mid 2014.

After the strongest year for non-OPEC production in 2014 (+2.4m b/day) since 1978, non-OPEC growth in 2015 was also strong, at 1.4m b/day. Whilst the sub-\$60 oil environment has caused significant deferral and cancellation of new developments, start-up projects that were sanctioned before the fall in the oil price are still coming to completion, creating this resilience in production. However, the effect of a low oil price impacted more in 2016, when non-OPEC supply fell by around 0.8m b/day. Non-OPEC supply recovered by 0.7m b/day in 2017, as US onshore production swung from decline back to growth.

The growth in US shale oil production, in particular from the Permian basin, raises the question of how much more there is to come and at what price. New oil production from these sources peaked in April 2015 at around 4m b/day, then declined by around 1.1m b/day, but has now passed the previous peak. Our assessment is that US shale oil is a capital intensive source of oil but one where real growth is viable, on average, at around \$50 oil prices. In particular, there appears to be ample inventory in the Permian basin to allow growth well into the 2020s. In total, it could be comparable in size to the UK North Sea, i.e. it could grow by around a further 4m b/day over the next five years, but only if the price is sufficiently high to incentivise growth. The rate of development is heavily dependent on the cashflow available to producing companies, which tends to be recycled immediately into new wells, and the underlying cost of services to drill and fracture the wells. Naturally, cashflows available for reinvestment in a \$60 world are far lower than in a \$100 world, but with efficiency improvements, enough to see growth sustaining.

Offsetting US onshore shale oil growth, we expect to see non-OPEC supply outside the US start to decline in 2019, as the queue of large conventional project start-ups dries up. Since 2014, the number of project start-ups in this region has been sustained at a high level, despite lower oil prices, since projects that were sanctioned before the 2014 (when oil was \$100+) have continued to come onstream. We believe 2019 marks a point, however, when the cancellation of projects that should have been sanctioned in 2015/16 starts to bite. A supply decline in the non-OPEC ex US region will increase the 'call' on US shale to balance the market.

Looking longer term, other opportunities to exploit unconventional oil likely exist internationally using techniques established in the US, notably in Argentina (Vaca Muerta), Russia (Bazhenov), China (Tarim and Sichuan) and Australia (Cooper). However, the US is far better understood geologically; the infrastructure in the US is already in place; service capacity in the US is high; and the interests of the landowner are aligned in the US with the E&P company. In most of the rest of the world, the reverse of each of these points is true, and as a result we see international shale being 10+ years behind North America.

Demand looking forward

The IEA estimate that 2017 oil demand growth was 1.6m b/day, and they expect a further increase of 1.5m b/day in 2018, taking demand to just over 99m b/day. Generally speaking, we have seen demand forecasts revised consistently higher since 2014, with the positive effect of lower oil prices continuing to surprise.

The IEA's global demand estimate for 2018 comprises an increase in non-OECD demand of 1.1m b/day and OECD demand growth of 0.4m b/day. The components of this non-OECD demand growth can be summarised as follows:

Figure 8: Non-OECD oil demand

m b/day	Demand								Growth							
	2011	2012	2013	2014	2015	2016	2017	2018e	2012	2013	2014	2015	2016	2017	2018e

Source: IEA Oil Market Report (May 2018)

Asia has settled down into a steady pattern of growth since 2010, and accounts for much of expected growth in 2017. Historically, China has been the most important component of this growth and continues to be a major component, although signs are emerging that India may also start to grow rapidly.

OECD demand in 2018 is forecast to be up by 0.4m b/day. In the US, the sharp fall in gasoline prices since 2014 has stimulated a reversal in improving fuel efficiency, as drivers switch back to purchasing larger vehicles, and a rise in total vehicle miles travelled, as shown in the chart opposite. Total vehicle miles travelled had stalled between 2007 and 2014, after two decades of growth, and are now growing again at a rate of around 1-2% per year.

The trajectory of global oil demand over the next few years will be a function of global GDP, pace of the 'consumerisation' of developing economies, and price. At current prices (\$60/bl), the world oil bill as a percentage of GDP is around 2.5%, likely stimulant of multi-year demand growth. If oil prices move to a higher range (say around \$75/bbl, representing 3% of GDP), we probably return to the pattern established over the past 5 years, with a flatter picture in the OECD more than offset by strong growth in the non-OECD area. Flatter OECD demand reflects improving oil efficiency over time, dampened by economic, population and vehicle growth. Within the non-OECD, population growth and rising oil use per capita will both play a significant part. Overall, we would not be surprised to see annual non-OECD demand growth of around 1.5m b/day by the end of the decade. This would represent a growth rate of 3% p.a., no greater than the growth rate over the last 15 years (3.2% p.a.).

We keep a close eye on developments in the 'new energy' vehicle fleet (electric vehicles; hybrids etc), but see nothing that makes a significant dent on the consumption of gasoline and diesel in the next few years. Sales of electric vehicles (pure electric and plug-in hybrid electrics) globally were around 1.2m in 2017, up from 0.8m in 2016. Sales of 1.6m electric vehicles represents around 1.5% of total light vehicle sales, and increases EV's share of the world car fleet to 0.25%. We expect to see EV sales accelerate in 2018 to around 1.9m, or 2% of total global sales. Even applying an aggressive growth rate to EV sales, we see EVs comprising only around 0.6% of the global car fleet in 2020. Looking further ahead, we expect the penetration of EV's to accelerate, causing global gasoline demand to peak at some point in the second half of the 2020s. However, owing to the weight of oil demand that comes from sources other than passenger vehicles (around 70%), which we expect to continue growing linked to GDP, we expect total oil demand not to peak until the mid 2030s.

Conclusions about oil

The table below summarises our view by showing our oil price forecasts for WTI and Brent in 2017 against their historic levels, and rises/falls in percentage terms that we have seen in the period from 2002 to 2016.

Figure 9: Average WTI & Brent yearly prices, and changes

We expect oil to trade in a \$55-70/bl range in the near term, supported at the lower end by OPEC. If this price range persists, we expect North American unconventional supply to sustain growth. We believe that the 'call' on unconventional supply, however, is likely to grow into the end of the decade, as conventional non-OPEC supply declines.

The world oil bill at around \$60/bl would represent 2.5% of 2018 Global GDP, 26% under the average of the 1970 – 2015 period (3.4%). A return to oil representing 3.4% of GDP implies an oil price of around \$80/bl.

We believe that Saudi's long-term objective remains to maintain a 'good' oil price, similar to current spot levels, and that will allow the country to IPO Saudi Aramco successfully in the next year or so.

Natural gas market

US gas demand

On the demand side, industrial gas demand and power generation gas demand, each about a quarter of total US gas demand, are key. Commercial and residential demand, which make up a further quarter, have been fairly constant on average over the last decade – although yearly fluctuations due to the coldness of winter weather can be marked.

Industrial demand (of which around 35% comes from petrochemicals) tends to trend up and down depending on the strength of the economy, the level of the US dollar and the differential between US and international gas prices. Between 2000 and 2009 industrial demand was in steady decline, falling from 22.2 Bcf/day to 16.9 Bcf/day. Since 2009 the lower gas price (particularly when compared to other global gas prices) and recovery from recession has seen demand rebound, up in 2017 to around 21.6 Bcf/day.

Electricity gas demand (i.e. power generation) is affected by weather, in particular warm summers which drive demand for air conditioning, but the underlying trend depends on GDP growth and the proportion of incremental new power generation each year that goes to natural gas versus the alternatives of coal, nuclear and renewables. Gas has been taking market share in this sector: in 2017, 33% of electricity generation was powered by gas, up from 22% in 2007. The big loser here is coal which has consistently given up market share over the past 10 years.

Bcf/day	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018E
US natural gas demand:												
Residential/commercial	21.2	22.0	21.6	21.6	21.6	19.2	22.4	23.4	21.4	20.5	20.9	21.7
Power generation	18.7	18.2	18.8	20.2	20.8	24.9	22.3	22.3	26.5	27.3	25.3	26.9
Industrial	18.2	18.2	16.9	18.5	19.0	19.7	20.3	20.9	20.6	21.1	21.6	22.2

Demand growth	4.0	0.8	- 0.6	3.2	2.5	3.0	1.8	0.9	3.0	2.6	0.5	4.5

Source: EIA; Simmons; Guinness estimates

Total gas demand in 2017 (including Canadian, Mexican and LNG exports) was 83.1 Bcf/day, up by just 0.5 Bcf/day (0.6%) versus 2016 but 5 Bcf/day (6.5%) higher than the 5 year average. LNG exports rose significantly this year (+2 Bcf/day), but offset by a 2 Bcf/day decline in demand from power generation, owing to normalising weather and gas to coal utility switching, prompted by prices back above \$3/mcf.

Demand outlook

We expect demand 2018, assuming prices remain around \$3/mcf, to exhibit strong growth of around 4.5 Bcf/day. We see several sources of higher demand driving this growth, including rising pipeline exports to Mexico, rising demand from power generation (gas taking share back from coal) and slightly higher LNG exports.

Looking out further, the low US gas price has stimulated various initiatives that are likely have an increasingly material impact on demand as we move through to the end of the decade. The most significant is the group of LNG export terminals in the US, many of which are still in the construction stages but will come online in 2019 and 2020. The table below shows the scheduled start-up of terminals, with 5.7 Bcf/day of capacity coming in 2019 – inevitably, some of this will be delayed into 2020.

Terminal	Location	2015	2016	2017	2018E	2019E	2020E
Cameron 1-2	LA					1.2

Total US LNG exports		0.1	1.1	3.1	3.4	9.1	9.1

Source: EIA; Simmons

Industrial demand will also grow thanks to the increased use of gas in the oil refining process and the construction of new petrochemical plants: Dow Chemical and Chevron Phillips have started up a large new Gulf Coast facility this year, the first new cracker to be built in the US since 2001.

We also believe that gas will continue to take the majority of incremental power generation growth in the US and continue to take market share from coal. Coal fired power generation closures have been a feature of 2015 as pollution standards come into force in an effort to reduce mercury and acid gases emissions, which likely accelerates the switch to gas. Our working assumption is for gas fired power generation to grow 0.8-1.2 Bcf/day per year, although this will be affected by actual gas prices.

US gas supply

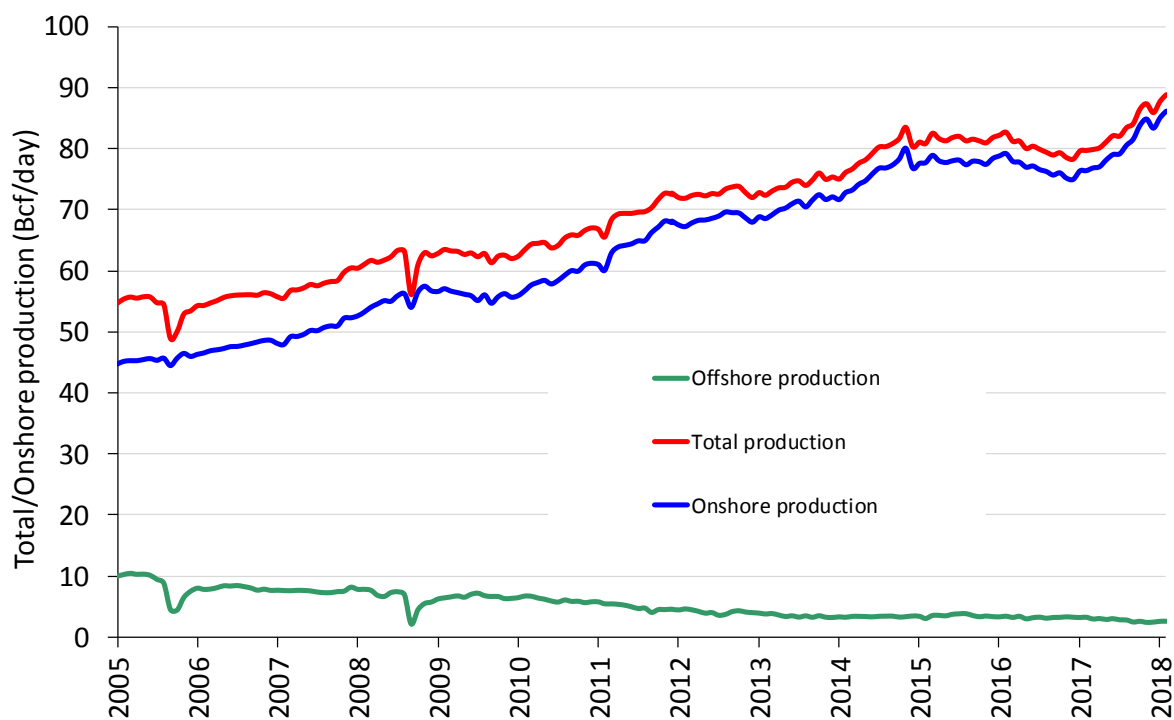

Overall, whilst gas demand in the US has been strong over the past five years, it has been overshadowed by a rise in onshore supply, pulling the gas price lower.

The supply side fundamentals for natural gas in the US are driven by 3 main moving parts: onshore and offshore domestic production, and pipeline imports of gas from Canada. Of these, onshore supply is the biggest component, making up over 85% of total supply.

Bcf/day	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018E
US natural gas supply:												
US onshore	45.1	48.8	49.8	52.2	57.7	61.5	62.7	67.5	70.6	69.4	70.4	77.3

Source: EIA; Simmons; Guinness estimates

Since the middle of 2008 the weaker gas price in the US reflects growing onshore US production driven by rising shale gas and associated gas production (a by-product of growing onshore US oil production). Interestingly, the overall rise in onshore production has come despite a collapse in the number of rigs drilling for gas, which has dropped from a 1,606 peak in September 2008 to only 81 in September 2016 and now 194 at the end of February 2018. However, offsetting the fall, the average productivity per rig has risen dramatically as producers focus their attention on the most prolific shale basins, whilst associated gas from oil production has grown handsomely. Onshore gas supply (gross, before processing) is now at 86.1 Bcf/day, 28.6 Bcf/day (50%) above the 57.4 Bcf/d peak in November 2008 before the rig count collapsed.

Figure 10: US natural gross gas production 2005 – 2018 (Lower 48 States)

Source: EIA 914 data (March 2018 published in June 2018)

Supply outlook

The outlook for gas production in the US depends on three key factors: the rise of associated gas (gas produced from wells classified as oil wells); expansion of the newer shale basins, principally the Marcellus/Utica, and the decline profile of legacy gas fields.

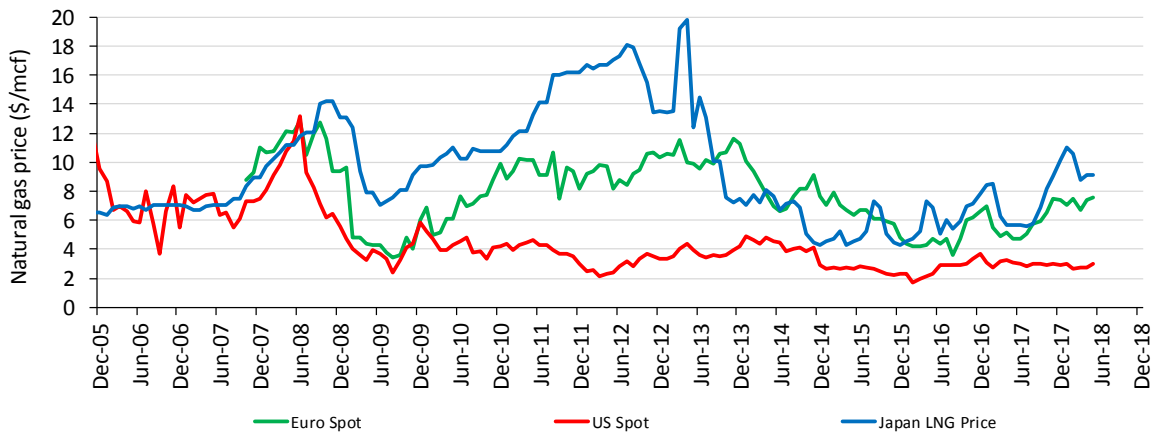

Associated gas production declined in 2016 with the fall of shale oil production, but as US oil supply now growing again, so associated gas production is also picking up. Generally, we expect to see rates of around 2-3 Bcf/day of associated gas per 1m b/day of oil production.

The Marcellus/Utica region, which includes the largest producing gas field in the US and the surrounding region, reached production of around 17 Bcf/day in 2016, though growth has recently slowed. Further growth is likely over the next couple of years, but only if local price differentials improve from the extreme levels seen in 2016. Then there is an expected decline in legacy gas fields, particularly if the gas drilling rig count stays low.

Overall, if the price remains in the \$2.50-\$3.50/mcf range, we expect a significant jump in onshore gas supply in 2018, up by around 5 Bcf/day versus this year.

Outlook for US LNG exports – global gas arbitrage

The prospects for US LNG exports depend on the differentials to European and Asian gas prices, and whether the economic incentive exists to carry out the trade. The UK national balancing point (NBP) gas price – which serves as a proxy to the European traded gas price – remains at a premium to the US gas price (c.\$7/mcf versus c.\$3/mcf). Asian spot LNG prices fell sharply down to around \$4.50/mcf at the start of 2016 but have since recovered to around \$9/mcf as Chinese gas demand strengthens. The implied economics are tight at these levels into Europe, better into Asia, but sufficient to expect exports to proceed.

Relationship with oil and coal

The oil/gas price ratio (\$ per bbl WTI/\$ per mcf Henry Hub) of around 23x at the end of May 2018 continues well outside the long-term ratio of 6-9x.

The following chart of the front month US natural gas price against heating oil (No 2), residual fuel oil (No 6) and coal (Sandy Barge adjusted for transport and environmental costs) seeks to illustrate how coal and residual fuel oil switching provide a floor and heating oil a ceiling to the natural gas price. When the gas price has traded below the coal price support level (2012 and 2016), resulting coal to gas switching for power generation was significant.

Supply growth	3.2	0.6	0.8	1.9	3.4	2.3	- 0.1	4.1	3.3	- 0.6	0.7	7.0
(Supply)/demand balance	- 0.1	0.1	- 1.3	-	- 0.9	- 0.2	1.7	- 1.5	- 1.8	1.4	1.2	- 1.3

The US natural gas price bottomed in 2012 and a tepid recovery since then has been muted by continued strength in gas supply, particularly from the Marcellus/Utica and from gas produced as a by-product of shale oil. Average 2016 natural gas prices (at \$2.55) were around 50% higher the April 2012 low, though we suspect that the (full cycle) marginal cost of supply remains above \$3.50. We do not believe the excess in production over demand can continue indefinitely with natural gas trading at this level: a combination of reduced capital spending by the producing companies and growing natural gas demand stimulated by the low gas price will create a new market equilibrium. As this all happens we expect the price to stabilise in the \$2.75 – \$3.25/mcf range. It may be held at this level for a period until demand grows further, and longer term we expect the price to normalise to the top end of this range.

3. APPENDIX Oil and gas markets historical context

Figure 12: Oil price (WTI \$) since 1989.

Source: Bloomberg LP

For the oil market, the period since the Iraq Kuwait war (1990/91) can be divided into two distinct periods: the first 9-year period was broadly characterized by decline. The oil price steadily weakened 1991 - 1993, rallied between 1994 - 1996, and then sold off sharply, to test 20 year lows in late 1998. This latter decline was partly induced by a sharp contraction in demand growth from Asia, associated with the Asian crisis, partly by a rapid recovery in Iraq exports after the UN Oil for food deal, and partly by a perceived lack of discipline at OPEC in coping with these developments.

The last 13 years, by contrast, have seen a much stronger price and upward trend. There was a very strong rally between 1999 and 2000 as OPEC implemented 4m b/day of production cuts. It was followed by a period of weakness caused by the rollback of these cuts, coinciding with the world economic slowdown, which reduced demand growth and a recovery in Russian exports from depressed levels in the mid 90's that increased supply. OPEC responded rapidly to this during 2001 and reintroduced production cuts that stabilized the market relatively quickly by the end of 2001.

Then, in late 2002 early 2003, war in Iraq and a general strike in Venezuela caused the price to spike upward. This was quickly followed by a sharp sell-off due to the swift capture of Iraq's Southern oil fields by Allied Forces and expectation that they would win easily. Then higher prices were generated when the anticipated recovery in Iraq production was slow to materialise. This was in mid to end 2003 followed by a much more normal phase with positive factors (China demand; Venezuelan production difficulties; strong world economy) balanced against negative ones (Iraq back to 2.5 m b/day; 2Q seasonal demand weakness) with stock levels and speculative activity needing to be monitored closely. OPEC's management skills appeared likely to be the critical determinant in this environment.

By mid-2004 the market had become unsettled by the deteriorating security situation in Iraq and Saudi Arabia and increasingly impressed by the regular upgrades in IEA forecasts of near record world oil demand growth in 2004 caused by a triple demand shock from strong demand simultaneously from China; the developed world (esp. USA) and Asia ex China. Higher production by OPEC has been one response and there was for a period some worry that this, if not curbed, together with demand and supply responses to higher prices, would cause an oil price sell off. Offsetting this has been an opposite worry that non-OPEC production could be within a

decade of peaking; a growing view that OPEC would defend \$50 oil vigorously; upwards pressure on inventory levels from a move from JIT (just in time) to JIC (just in case); and pressure on futures markets from commodity fund investors.

After 2005 we saw a further strong run-up in the oil price. Hurricanes Katrina and Rita, which devastated New Orleans, caused oil to spike up to \$70 in August 2005, and it spiked up again in July 2006 to \$78 after a three week conflict between Israel and Lebanon threatened supply from the Middle East. OPEC implemented cuts in late 2006 and early 2007 of 1.7 million barrels per day to defend \$50 oil and with non-OPEC supply growth at best anaemic demonstrated that it could to act a price-setter in the market at least so far as putting a floor under it.

Continued expectations of a supply crunch by the end of the decade, coupled with increased speculative activity in oil markets, contributed to the oil price surging past \$90 in the final months of 2007 and as high as \$147 by the middle of 2008. This spike was brought to an abrupt end by the collapse of Lehman Brothers and the financial crisis and recession that followed, all of which contributed to the oil price falling back by early 2009 to just above \$30. OPEC's responded decisively and reduced output, helping the price to recover in 2009 and stabilise in the \$70-95 range where it remained for two years.

Prices during 2011-2014 moved higher, averaging around \$100, though WTI generally traded lower than Brent oil benchmarks due to US domestic oversupply affecting WTI. During this period, US unconventional oil supply grew strongly, but was offset by the pressures of rising non-OECD demand and supply tensions in the Middle East/North Africa.

Most recently, since the end of 2014, Brent and WTI have dropped well below these trading ranges, as OPEC made clear their intention not to support the price, leaving the market oversupplied. Oil prices found a bottom in 2016 as a result of OPEC cutting production again, but remains capped for the timebeing by US onshore shale supply.

Figure 13: North American gas price since 1991 (Henry Hub \$/Mcf)

Source: Bloomberg LP

With regard to the US natural gas market, the price traded between \$1.50 and \$3/Mcf for the period 1991 - 1999. The 2000s were a more volatile period for the gas price, with several spikes over \$8/mcf, but each lasting less than 12 months. On each occasion, the price spike induced a spurt of drilling which brought the price back down. Excepting these spikes, from 2004 to 2008, the price generally traded in the \$5-8 range. Since 2008, the price has averaged below \$4 as progress achieved in 2007-8 in developing shale plays boosted supply while the 2008-09 recession cut demand. Demand has been recovering since 2009 but this has been outpaced by

continued growth in onshore production, driven by the prolific Marcellus/Utica field and associated gas as a by-product of shale oil production.

North American gas prices are important to many E&P companies. In the short-term, they do not necessarily move in line with the oil price, as the gas market is essentially a local one. (In theory 6 Mcf of gas is equivalent to 1 barrel of oil so \$60 per barrel equals \$10/Mcf gas). It remains a regional market more than a global market because the infrastructure to export LNG from North America is not yet in place.

IMPORTANT INFORMATION AND RISK FACTORS

Issued by Guinness Asset Management Limited, authorised and regulated by the Financial Conduct Authority.

This report is primarily designed to inform you about recent developments in the energy markets invested in by the Guinness Global Energy Fund. It may also provide information about the Fund's portfolio, including recent activity and performance. It contains facts relating to the energy market and our own interpretation. Any investment decision should take account of the subjectivity of the comments contained in the report.

This document is provided for information only and all the information contained in it is believed to be reliable but may be inaccurate or incomplete; any opinions stated are honestly held at the time of writing, but are not guaranteed. The contents of the document should not therefore be relied upon. It should not be taken as a recommendation to make an investment in the Fund or to buy or sell individual securities, nor does it constitute an offer for sale.

Risk

The Guinness Global Energy Fund is an equity fund. Investors should be willing and able to assume the risks of equity investing. The value of an investment and the income from it can fall as well as rise as a result of market and currency movement, and you may not get back the amount originally invested. The Fund invests only in companies involved in the energy sector; it is therefore susceptible to the performance of that one sector, and can be volatile. Details on the risk factors are included in the Fund's documentation, available on our website.

Documentation

The documentation needed to make an investment, including the Prospectus, the Key Investor Information Document (KIID) and the Application Form, is available from the website www.guinnessfunds.com, or free of charge from:

- the Manager: Link Fund Manager Solutions (Ireland) Ltd, 2 Grand Canal Square, Grand Canal Harbour, Dublin 2, Ireland; or,
- the Promoter and Investment Manager: Guinness Asset Management Ltd, 14 Queen Anne's Gate, London SW1H 9AA.

Residency

In countries where the Fund is not registered for sale or in any other circumstances where its distribution is not authorised or is unlawful, the Fund should not be distributed to resident Retail Clients. **NOTE: THIS INVESTMENT IS NOT FOR SALE TO U.S. PERSONS.**

Structure & regulation

The Fund is a sub-fund of Guinness Asset Management Funds PLC (the "Company"), an open-ended umbrella-type investment company, incorporated in Ireland and authorised and supervised by the Central Bank of Ireland, which operates under EU legislation. If you are in any doubt about the suitability of investing in this Fund, please consult your investment or other professional adviser.

Switzerland

The prospectus and KIID for Switzerland, the articles of association, and the annual and semi-annual reports can be obtained free of charge from the representative in Switzerland, Carnegie Fund Services S.A., 11, rue du Général-Dufour, 1204 Geneva, Switzerland, Tel. +41 22 705 11 77, www.carnegie-fund-services.ch. The paying agent is Banque Cantonale de Genève, 17 Quai de l'Île, 1204 Geneva, Switzerland.

Singapore

The Fund is not authorised or recognised by the Monetary Authority of Singapore ("MAS") and shares are not allowed to be offered to the retail public. The Fund is registered with the MAS as a Restricted Foreign Scheme. Shares of the Fund may only be offered to institutional and accredited investors (as defined in the Securities and Futures Act (Cap.289)) ('SFA') and this material is limited to the investors in those categories

Telephone calls will be recorded and monitored.
